Hello World: <a href="https://play.golang.org">https://play.golang.org</a>

### Basic syntax code in playground:

https://tinyurl.com/y7rdgqj3

```
// All files start with a package declaration
package main
// Import statements, one package on each line
import (
    'errors
// Main method will be called when the Go executable is run
func_main() {
   fmt.Println("Hello world(3))
    basic()
   add(1, 2)
   divide(3, 4)
   loops()
   slices()
   maps()
    sharks()
```

```
// Function declaration
func basic() {
    // Declare x as a variable, initialized to 0
                                                   Var XX Ctring
   var x int )
    // Declare y as a variable, initialized to 2
   var y int = 2
   // Declare z as a variable, initialized to 4
                                             String-tmp := "hello"
   // This syntax can only be used in a function
    // Assign values to variables
    x = 1
   z = x + 2 * y + 3
    // Print the variables; just use %v for most types
   fmt.Printf("x = \sqrt[4]{v}, y = \sqrt[4]{v}, z = \sqrt[4]{n}", x, y, z)
```

```
// Function declaration; takes in 2 ints and outputs an int
fund add(x, y(int)(int){
    return x + y
// Function that returns two things; error is nil if successful
func divide(x, y int) (float64, error) {
    if y == 0 {
        return 0.0, errors. New ("Divide by zero")
    // Cast x and y to float64 before dividing
    return float64(x) / float64(y), nil
```

```
func loops() {
    // For loop
    for i := 0; i < 10; i++ {
        fmt.Print(".")
    }
    // While loop
    sum := 1
    for sum < 1000 {
        sum *= 2
    }
    fmt.Printf("The sum is %v\n", sum)</pre>
```

```
func slices() {
   slice := []int{1, 2, 3, 4, 5, 6, 7, 8}
    fmt.Println(slice)
    fmt.Println(slice[2:5]) // 3, 4, 5
    fmt.Println(slice[5:]) // 6, 7, 8
    fmt.Println(slice[:3]) // 1, 2, 3
   slice2:=(make([]string, 3)
   slice2[0] = "tic" ^
    slice2[1] = "tac"
    slice2[2] = "toe"
    fmt.Println(slice2)
    slice2/= append(slice2, "tom")
    slice2 = append(slice2, "radar")
    fmt.Println(slice2)
    for index, value := range slice2 {
        fmt.Printf("%v: %v\n", index, value)
    fmt.Printf("Slice length = %v\n", len($lice2))
```

```
func maps() {
    myMap := make(map[string]int)
    myMap["yellow"] = 1
    myMap["magic"] = 2
    myMap["amsterdam"] = 3
    fmt.Println(myMap)
    myMap["magic"] = 100
    delete(myMap, "amsterdam")
    fmt.Println(myMap)
    fmt.Println(myMap)
    fmt.Println(myMap)
```

```
// Object oriented programming
// Convention: capitalize first letter of public fields
type Shark struct {
   Name string
   Age int
// Declare a public method
// This is called a receiver method
func (s *Shark) Bite() {
   fmt.Printf("%v says CHOMP!\n", s.Name)
// Because functions in Go are pass by value
// (as opposed to pass by reference), receiver
// methods generally take in pointers to the
// object instead of the object itself.
func (s *Shark) ChangeName(newName string) {
   s.Name = newName
```

```
// Receiver methods can take in other objects as well
func (s *Shark) Greet(s2 *Shark) {
   if (s.Age < s2.Age) {
       fmt.Printf("%v says your majesty\n", s.Name)
   } else {
       fmt.Printf("%v says yo what's up %v\n",
            s.Name, s2.Name)
func sharks() {
   shark1 := Shark{"Bruce", 32}
   shark2 := Shark{"Sharkira", 40}
   shark1.Bite()
   shark1.ChangeName("Lee")
   shark1.Greet(&shark2) // pass in pointer
   shark2.Greet(&shark1)
```

```
// Channels are a way to pass messages across goroutines
func channels() {
   ch := make(chan int)
   // Launch a goroutine using an anonymous function
   go func() {
        i := 1
        for {
            // This line blocks until someone
            // consumes from the channel
            ch <- i * i
            j++
   // Extract first 10 squared numbers from the channel
   for i := 0; i < 10; i++ \{
        // This line blocks until someone sends into the channel
        fmt.Printf("The next squared number is %v\n", <-ch)
```

```
// Buffered channels are like channels except:
// 1. Sending only blocks when the channel is full
// 2. Receiving only blocks when the channel is empty
func bufferedChannels() {
   ch := make(chan int, 3)
   ch <- 1
   ch <- 2
   ch <- 3
   // Buffer is now full; sending any new messages will block
   // Instead let's just consume from the channel
   for i := 0; i < 3; i++ {
        fmt.Printf("Consuming %v from channel\n", <-ch)
   // Buffer is now empty; consuming from channel will block
```
